

The RACER Trust: Empowering America's Auto Communities

Buena Vista Township, MI RACER Site 10040

Saginaw Nodular Industrial Land
2100 Veterans Memorial Parkway
Buena Vista Township, MI

Updated September 2023

Site Description

The Saginaw Nodular Iron Property is 226.83 acres of vacant land straddling the City of Saginaw and Buena Vista Township.

The Property was a portion of the Saginaw Casting Complex — an approximately 700-acre site that began operation in the 1920s. The Nodular Iron Plant and wastewater treatment facility were developed at the Property in the late 1970s and the plant operated until 1987. The wastewater treatment facility was operated until 2010.

The plant building was decommissioned and removed in the late 1990s and the wastewater treatment building was decommissioned and demolished in late 2015 and early 2016.

The environmental remediation of the Property is being managed through the RCRA Corrective Action program under a Resource Conservation and Recovery Act (RCRA) Administrative Order on Consent (AOC), with the United States Environmental Protection Agency (USEPA), effective September 29, 2011. RACER Trust is performing remediation activities with the approval and oversight of USEPA Region 5. The Settlement Agreement that established RACER Trust set aside \$4.7 million for remediation work at this Property.

Environmental History

Several investigations of environmental conditions at the Property have been conducted since the late 1980s and have found the presence of metals and PCBs in soils and sediments, and ammonia and elevated pH in groundwater.

Continued

Other compounds found in limited areas of the Property at relatively low concentrations include volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and cyanide.

In 2013, remedial contractors completed stabilizing the primary settling basins at the wastewater treatment facility in accordance with a USEPA- approved work plan. In 2014, drainage improvements were made along the railroad tracks that run southwest to northeast through the Property.

In 2019, approximately 3,000 tons of PCB-impacted sediments were removed from the western portion of the secondary ponds and disposed off-site in accordance with a USEPA-approved work plan. This activity allowed for discharge from the secondary ponds without a permit.

In 2020, approximately 100 tons of PCB-impacted soils were removed from a small area south of the former Nodular Iron Plant and disposed off-site in accordance with a USEPA-approved work plan.

In 2021, an updated corrective measures proposal was submitted to USEPA. RACER has responded to USEPA comments on the proposal.

In 2022, an updated mixing zone-based groundwater surface water interface (GSI) criteria for ammonia and pH was submitted to USEPA and EGLE. In accordance with the recommendations from EGLE, a groundwater sampling event was conducted later in 2022. The sampling results confirmed that groundwater concentrations were below the mixing zone-based GSI criteria.

In 2023, seven existing on-Site monitoring wells were sampled and analyzed for PFAS and 1,4-dioxae at USEPA's request. The results are currently being evaluated.

Next Steps

Current activities include groundwater monitoring related to the GSI pathway. Any additional investigation or monitoring is dependent upon the PFAS sampling results. When USEPA determines the PFAS sampling data is acceptable, it is anticipated that USEPA will initiate the RCRA Corrective Action final remedy selection process.

It is expected that the final remedy will include deed restrictions. These restrictions will, among other restrictions, limit use of the Property to nonresidential, prohibit use of groundwater, require soil vapor management, and require contaminated soil management. In addition, there may be area-specific restrictions, such as for residual PCBs in the western portion of the secondary ponds.

Information on the site and past environmental tests can be viewed at the RACER website at www.racertrust.org.
